### 1. Unit 05: Estimation and Hypothesis Testing Questions

#### 4.1.1. A beverage filling machine, when in perfect adjustment, fills bottl...

Author: David Bourgeois

A beverage filling machine, when in perfect adjustment, fills bottles of Sierra Nevada Pale Ale® with 12 ounces of refreshment. A random sample of 51 bottles is selected and the contents are measured. The sample yields a mean content of 11.88 ounces with a sample standard deviation of 0.3565 ounces. If the p-value associated with the test statistic equals 0.001, this will lead you to do which of the following?

Please choose only one answer:

- Reject the null hypothesis and conclude that the machine fills the bottles at a value statistically different from 12 ounces
- Reject the null hypothesis and conclude that the machine fills the bottles at a value statistically less from 12 ounces
- Fail to reject the null hypothesis and prove that the machine fills the bottles at a value equal to 12 ounces
- Fail to reject the null hypothesis and conclude there is not enough evidence to show the machine fills the bottles at a value statistically different than 12 ounces

Author: David Bourgeois

A new dental office has just opened in the town of Newsville. The owners of the dental practice decided to locate in Newsville based on the assumption that the new practice would see an average of 35 patients a month in the first year of business. Which of the following statements on the null and alternative hypotheses best represents this scenario (assume that  $\mu$  represents the number of patients per month)?

Please choose only one answer:

- $\begin{matrix} H_0: \mu = 35 & \text{and} & H_A: \mu < 35 \end{matrix}$
- $\begin{matrix} H_0: \mu = 35 & \text{and} & H_A: \mu \leq 35 \end{matrix}$
- $\begin{matrix} H_0: \mu = 35 & \text{and} & H_A: \mu \neq 35 \end{matrix}$
- $\begin{matrix} H_0: \mu \neq 35 & \text{and} & H_A: \mu = 35 \end{matrix}$

Author: David Bourgeois

A study of college students in 1999 found that 202 out of 1,195 students received work-study grants. A 2007 study found that 779 students out of 5,727 received such grants. We want to test if the proportion of students receiving work study grants declined between 2007 ( $p_2$ ) and 1999 ( $p_1$ ). What is the null hypothesis for the test?

Please choose only one answer:

- $\begin{matrix} H_0: p_2 \geq p_1 & H_A: p_2 < p_1 \end{matrix}$
- $\begin{matrix} H_0: p_2 = p_1 & H_A: p_2 < p_1 \end{matrix}$
- $\begin{matrix} H_0: p_2 = p_1 & H_A: p_2 \neq p_1 \end{matrix}$
- $\begin{matrix} H_0: p_2 \leq p_1 & H_A: p_2 > p_1 \end{matrix}$

Author: David Bourgeois

Assume the federal government releases an estimate of an increase of 250,000 new jobs for the month of January. However, a sample taken of 20 economists provides an average estimated number of new jobs totaling 266,000, with a sample standard deviation of 24,000. Treat the federal government's estimate as the population mean. Say you wish to test if the economists' estimate represents a statistically significant increase over the federal government's estimate for the job increase. Which of the following accurately represents the null hypothesis of that test?

Please choose only one answer:

- $H_0: \mu \leq 250,000$
- $H_0: \mu \geq 250,000$
- $H_0: \mu = 250,000$
- $H_0: \mu = 0$

Author: David Bourgeois

Assume the federal government releases an estimate of an increase of 250,000 new jobs for the month of January. However, a sample taken of 20 economists provides an average estimated number of new jobs totaling 266,000, with a sample standard deviation of 24,000. Treat the federal government's estimate as the population mean. Say you wish to test if the economists' estimate represents a statistically significant increase over the federal government's estimate for the job increase. Based on this information, which of the following statements is true?

Please choose only one answer:

- To evaluate the null hypothesis and calculate the appropriate test statistic, you will need to refer to the Z-distribution.
- To evaluate the null hypothesis and calculate the appropriate test statistic, you will need to refer to the t-distribution with degrees of freedom equal to 20.
- To evaluate the null hypothesis and calculate the appropriate test statistic, you will need to refer to the t-distribution with degrees of freedom equal to 19.
- To evaluate the null hypothesis and calculate the appropriate test statistic, you will need to refer to the t-distribution with degrees of freedom equal to 250,000.

Based on this information, which of the following statements is true?

Please choose only one answer:

- To evaluate the null hypothesis and calculate the appropriate test statistic, you will need to refer to the Z-distribution.
- To evaluate the null hypothesis and calculate the appropriate test statistic, you will need to refer to the t-distribution with degrees of freedom equal 32.
- To evaluate the null hypothesis and calculate the appropriate test statistic, you will need to refer to the t-distribution with degrees of freedom equal 31.
- To evaluate the null hypothesis and calculate the appropriate test statistic, you will need to refer to the t-distribution with degrees of freedom equal 6,000.

Which of the following best describes the P-value associated with a hypothesis test?

Please choose only one answer:

- The p-value is the smallest alpha (?) for which we reject the null hypothesis.
- The p-value is the largest alpha (?) for which we reject the null hypothesis.
- The p-value is the smallest alpha (?) for which we fail to reject the null hypothesis.
- The p-value is the largest alpha (?) for which we fail to reject the null hypothesis.

Author: David Bourgeois

A beverage filling machine, when in perfect adjustment, fills bottles of Sierra Nevada Pale Ale® with 12 ounces of refreshment. A random sample of 51 bottles is selected and the contents are measured. The sample yields a mean content of 11.88 ounces with a sample standard deviation of 0.3565 ounces. Compute the value of the appropriate test statistic for carrying out the hypothesis.

#### 4.1.24. A new dental office opens in the town of Newsville. The owners of t...

Author: David Bourgeois

A new dental office opens in the town of Newsville. The owners of the dental practice decided to locate in Newsville based on the assumption that the new practice would see an average of 35 patients a month in the first year of business. After three months in business, the owners confidentially conclude they underestimated the average by more than 20 patients and think they should open a second location in town. However, the average for the first 3 months is a clerical error, and in truth, they have averaged just about 35 patients a month. The dental office's clerical error is an example of which of the following?

Please choose only one answer:

- A Type I error
- A Type II error
- Both a Type I and a Type II error
- The power of the hypothesis test
